1. Executive Summary

MedfirstIndia (MFI) is failing because it does not have a process for monitoring how its marketing budget is allocated, not because its campaigns are badly managed. The channel split agreed with the agency at launch has remained unchanged for eleven full quarters, including four of continuous revenue decline.

Therefore, the consequence is that paid search and social media have absorbed 92% of media spend and generated 13% of revenues, while organic search, direct and referral traffic generated 86% of revenues without any media spend. Over three years, MFI generated ₹0.79 in revenue for every ₹1.00 spent on marketing and spent ₹24,742 to acquire a customer whose average order value was ₹4,682. Traffic from referral, which is the company's best performing channel, achieved a conversion rate of 2.90% and generated ₹168.50 in revenue per visit compared with ₹12.67 from paid search, despite receiving no budget. Moreover, MFI generated ₹58,884 in gross profit per month with a gross margin of 25%, whilst allocating ₹200,000 per month to advertising alone, representing an overspend of 3.40 times.

The recommendation is that MFI reallocate expenditure towards referral partnerships with five identified specialist medical portals, create a first-party email programme and a retention programme for existing buyers, while reducing media expenditure to approximately ₹58,000 per month. It also needs to stop campaigns on Google Display and Instagram and renegotiate the agency's fee on the basis of results. These actions will be implemented over a six-month period and managed by a four-tier measurement framework with a monthly reallocation decision, and they will bring the company's marketing from a net contribution of -₹8,680,175 to break-even on media, provided the 86% of revenue that already arrives without media support holds.

2. Client Challenge and Problem Definition

Analysing MFI's three years of digital marketing activity, it is possible to identify a consistent pattern of problems: revenue grew throughout 2017, then fell at the beginning of 2018; campaigns targeting specific product categories, such as wheelchairs and stethoscopes, generated revenue spikes that faded as soon as the investment stopped; the call centre failed to secure long-term B2B contracts; revenue concentrated in four or five major cities, contradicting the founders' argument that small towns were an underserved market, and competitors drove up keyword costs faster than MFI could react.

Each of these issues appears as a distinct execution problem specific to a particular channel, but, in reality, they point to a single underlying strategic problem, which has been identified in the fact that MFI did not have a functioning mechanism for reallocating marketing spend in response to the gathered performance data. In fact, the company set the budget allocation across the five channels at the beginning of the partnership with the agency, and it had never been reviewed as part of an ongoing, result-based management process.

The two factors that contributed to this situation were that the agency received a flat-rate fee plus a fixed media budget, so neither party reduced the spending on underperforming channels or redirected it towards channels with better conversion rate, and that the implementation of Google Analytics was incomplete because many product pages had never been linked to tracking, and several campaigns were not linked to revenue attribution, meaning that the company did not have the data required to take action.

Therefore, the question is not how MFI should improve its campaign, but how much it should spend, on which channels, and through what recurring, data-driven process this allocation decision should be reviewed. MFI measured traffic and engagement at every stage but never traced expenditure, which is an important part of the marketing productivity chain, in which firms must trace expenditure through to intermediate outcomes and ultimately financial return (Rust et al., 2004; Hanssens and Pauwels, 2016). Moreover, MFI's broken tracking infrastructure was the cause of its decline because if a company deploys marketing analytics capabilities more fully, it achieves materially better financial performance (Germann, Lilien and Rangaswamy, 2013).

3. Evidence and Data Analysis

The data analysis of channel performance reveals an inversion between where MFI invested its marketing budget and where the revenue came from. Organic search, referral and direct traffic generated respectively 38.58%, 27.34% and 20.10% of revenue with a 0% media spend, while, by contrast, paid search absorbed 50% of media spend for only 7.22% of revenue, at a ROAS of 0.17, social absorbed 41.67% of spend for 5.92% of revenue, also at a 0.17 ROAS, and email absorbed 8.33% of spend for 0.84% of revenue, at a 0.12 ROAS (see Figure 1; full channel metrics are given in Appendix A, Table 1).

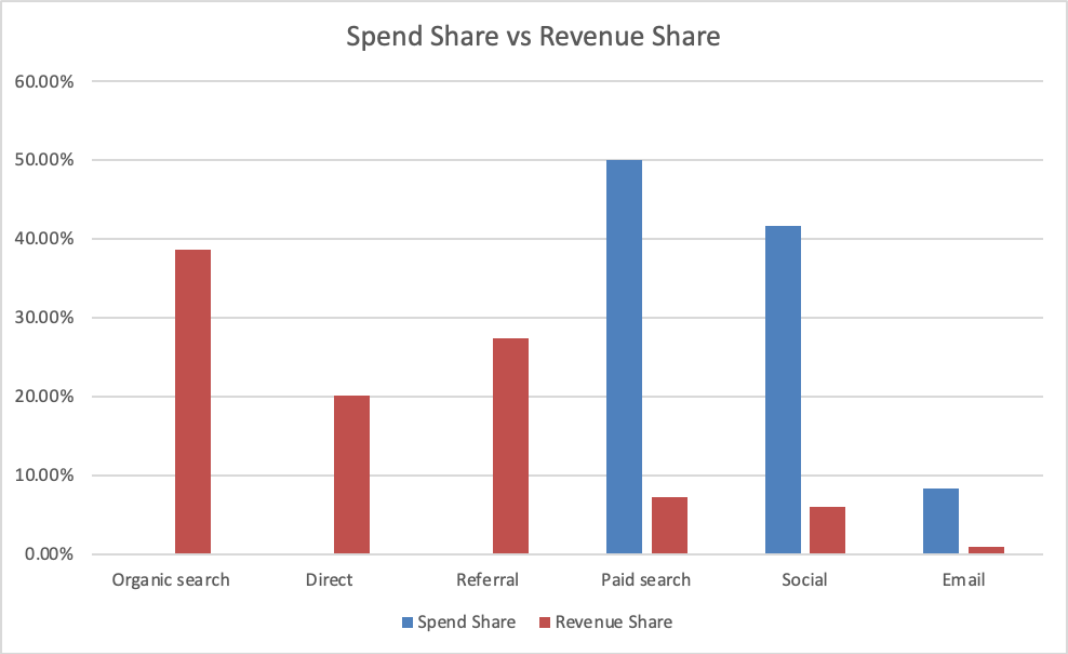

Figure 1 – Share of media spend vs share of revenue, by channel

Thus, across the three years, MFI generated only ₹0.79 of revenue per ₹1.00 of marketing spend, turning ₹10.8 million into ₹8.5 million before cost of goods. Moreover, at an assumed 25% gross margin, net contribution was -₹8,680,175, and customer acquisition cost (CAC) reached ₹24,742 against an average order value (AOV) of ₹4,682, a ratio of 5.28, meaning that MFI paid over five times the value of the order to acquire the customer who placed it. MFI would have needed a gross margin above 600% for its paid channels to cover the costs at a 0.17 ROAS. Thus, regardless of the assumed margin, paid media destroy value because acquisition cost is justified only by the present value of the purchases it generates, and MFI states that it did not secure any long-term contracts or sustainable recurring business, so there was no future value from which to recover the ₹24,742 CAC, which at a 25% margin on a ₹4,682 order would require 21 orders (Gupta, Lehmann and Stuart, 2004). Paid search also does not earn its budget as an assist channel because paths containing paid search account for 127 assisted conversions worth ₹319,400, against a media cost of ₹3.6 million.

The waste was further concentrated in paid channels because Display and Instagram together generated 18,100 sessions but returned only 19 orders. Behavioural data confirm this because Display bounced at 33.20% with a 48-second average session duration, and Instagram bounced at 36.10% with a 77-second average session duration. An average session duration of 48 seconds is not an indication for optimisation but evidence of the wrong audience and calls for pausing the campaign rather than correcting it. However, a limitation should be highlighted: MFI data does not report spend below channel level, so the cost of Display and Instagram cannot be isolated. This gap in data quality constitutes a significant governance finding.

Moreover, the channel that MFI never funded was the one performing the best because referral traffic produced 27.34% of revenue with 0% media spend, converted at 2.90% against

a 0.50% site average, carried the highest AOV of any channel at ₹5,811, and generated revenue per visit of ₹168.50 against ₹12.67 for paid search, which is 13.3 times higher (see Figure 2).

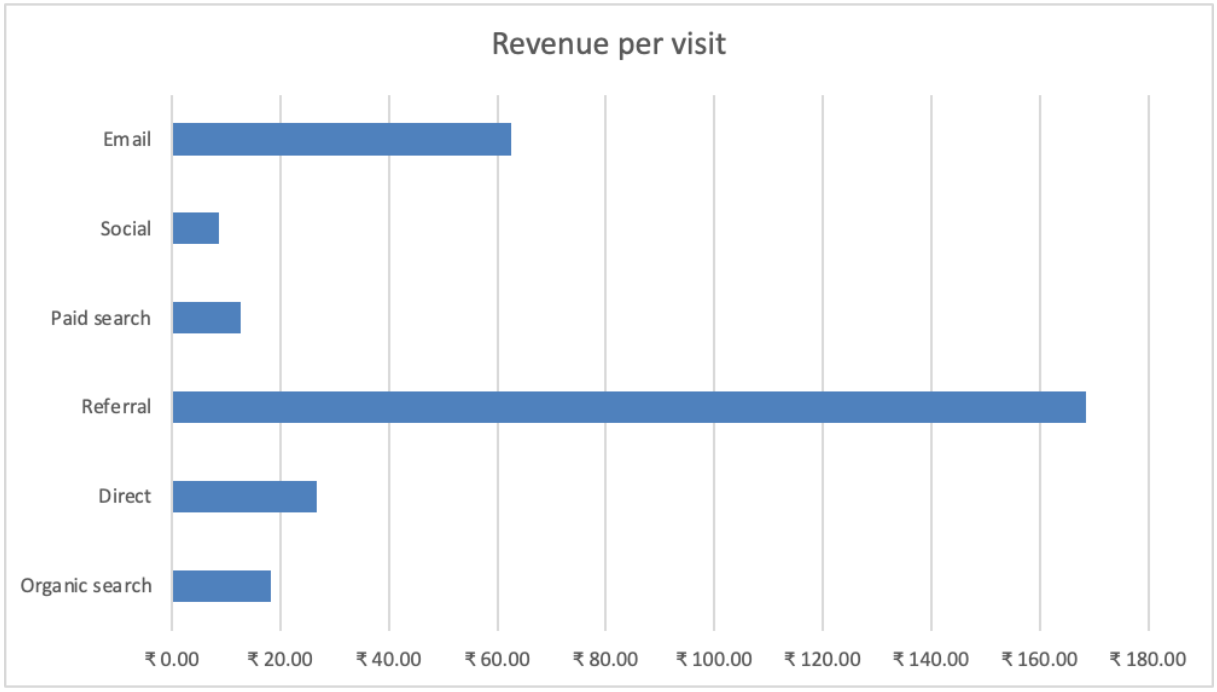

Figure 2 – Revenue per session by channel

The referral sources were practomed.in, medibuyerindia.com, clinicianconnect.in, hospitalsourcing.co.in and indiahealthforum.org, which are five specialist Indian clinical and medical trade sites that represent exactly where MFI's target buyers, doctors aged 35 to 54 (the two groups that generate 73% of MFI's transactions) who run a polyclinic or independent practice, already spend their professional time. Thus, MFI obtained its best customers essentially by accident, from exactly the destinations its own research had identified. It is also important to highlight a discrepancy: channel performance data records 13,760 referral sessions and 399 transactions, with a conversion rate of 2.90%, but the source distribution accounts only for 6,720 sessions and 121 transactions once youtube.com is excluded as a non-trade referrer, leaving the rest unattributed. This is a tracking failure and it is compounded by an untagged "referral / (not set)" group that comprises 2,650 sessions converting at 0.68%. However, the sole analysis of the five identifiable specialist medical portals produces 3,090 sessions and 89 transactions with a conversion rate of 2.88% that is consistent with the channel performance figure. This pattern is consistent with the fact that acquisition through referral can outperform traditional paid marketing for the number of acquisitions and duration over time (Trusov, Bucklin and Pauwels, 2009).

Thus, the audience that MFI targeted was the wrong half because returning visitors converted at 0.148% against 0.019% for new visitors, which is 7.94 times better, and represents 73.8% of the orders it records from a quarter of total sessions, while almost all media spend was directed to new-visitor acquisition. However, the behavioural funnel sheet records only 191 transactions compared with 1,811 at channel level, so the comparison is based on a tenth of

MFI's orders and indicates a trend rather than a specific figure, which is another sign of the ineffectiveness of the monitoring. This highlights that firms must link progression to profit outcomes rather than to traffic volume only, which is precisely the analytical step MFI never did (Wiesel, Pauwels and Arts, 2011).

Finally, the quarterly data shows a process failure, because spend by channel is identical across every full quarter but revenue peaks at ₹790,000 in 2017 Q2 and then declines in every quarter to ₹540,000 in 2018 Q2, while the allocation never moves (see Figure 3). However, quarterly data also records only ₹2,146,000 of media spend compared with ₹7,200,000 at channel level, a gap of more than three times. The analysis uses the channel figure as it corresponds to the ₹200,000 monthly media budget stated in the dataset, but the discrepancy is clear evidence of the identified reporting failure (see Appendix C, Table 2).

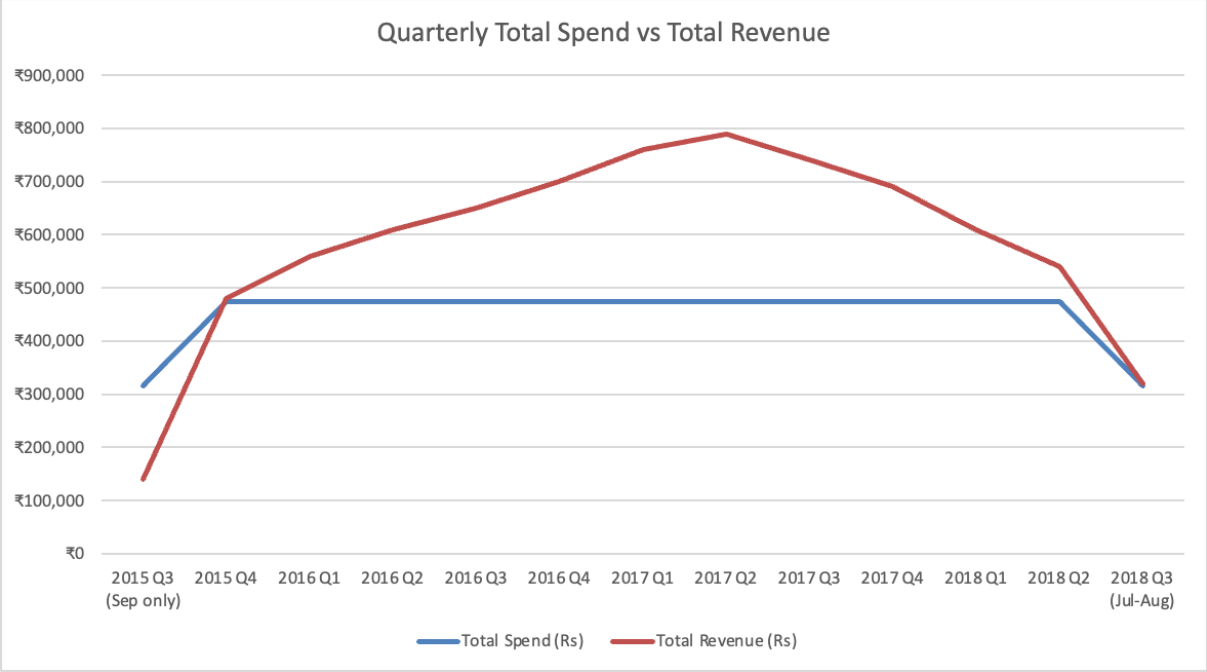

Figure 3 – Quarterly spend vs revenue, 2015-2018

4. Diagnostic Insight

The inversion has an identifiable cause in the fact that MFI's actual customers arrived through specialist professional contexts, but the company bought general-purpose consumer advertising for its specialist professional products (Lilien, 2016). The company's research correctly identified doctors aged 35 to 45 as active on Facebook, but Facebook targets who someone is as a person, while a clinical procurement portal captures what they are actively looking for because the context is more specific and restricted. Thus, for a considered B2B purchase, contextual relevance is more important than demographic reach because the value of a touchpoint depends on its position within the customer journey, not on the size of the audience it happens to reach (Lemon and Verhoef, 2016). This is also why a demographically

well-targeted Facebook ad might perform worse than an untargeted referral link in a specialist clinical forum.

MFI also made an error of governance because the initial allocation, agreed with the agency before any channel had performed, was plausible, but leaving the allocation unchanged across eleven consecutive quarters, four of them of continuous revenue decline, was not a defensible marketing strategy. MFI could not have corrected the misallocation because its 24,260 sessions (6.7%) and ₹2,000,600 of revenue (23.6%) appear at a channel level with no identifiable source, and total revenue differs by 10.5% between the channel and quarterly reports. The marketing budget allocation should function as a repeated, data-driven optimisation, rather than a single figure fixed at the beginning (Fischer et al., 2011), but a company that cannot say where a fifth of its revenue came from, or report its three-year turnover with a margin of error of less than 10%, has no basis on which to reallocate a budget.

However, the most important insight is that at a 25% gross margin, MFI's three-year gross profit was ₹2,119,825, roughly ₹58,884 per month. Moreover, the company committed ₹200,000 per month to media spend only, a 3.40 times overcommitment, with an extra ₹100,000 monthly agency retainer, which wasn't included in the media spend. Thus, MFI's marketing budget was never sustainable, regardless of how it might have been allocated across the various channels, because it was set on what the company wanted to spend, not on what an order of ₹4,682 with a 25% margin could actually sustain. No reallocation could have saved an advertising budget 3.40 times larger than the gross profit that funded it.

5. Strategic Options

Based on the analysis, it is possible to suggest three strategic options:

Option 1: The company could optimise the existing campaign mix by improving keywords, creative and landing pages, maintaining the same budget and channel mix. This strategy has the lowest impact because even if the company doubles paid conversion, the ROAS would only increase from 0.17 to 0.34 and its value will still be below the 4.00 required to break even with a 25% margin. The feasibility is high because there is no need for a renegotiation with the agency, but the risk is also high because it silently consumes MFI's remaining money without correcting the budget allocation problem.

Option 2: MFI could reallocate the budget toward earned and owned media and redirect it toward referral partnerships, email and retention based on customer relationship management (CRM) (Reichheld and Sasser, 1990), reducing in this way media spend to roughly ₹58,000 per month, which is in line with actual gross profit, and reinvesting the released cash into the organic and content activity that already generates 38.58% of revenue at zero media cost. This strategy simultaneously addresses both the channel mix and the level of expenditure. It has a realistic impact, and its feasibility is moderate because it requires a capability for partnerships that MFI does not currently have and a renegotiation of the agreement with the agency. The main risk is that in the Indian medical sector the space for

advertising is limited; therefore the channel may not be able to absorb a substantially larger reallocated budget. The five portals currently generate a total of ₹14,000 per month, so the target of ₹60,000 per partner per month represents a growth ambition to be tested through pilot projects, not a forecast. However, earned media generate more sales per visit than paid media with equivalent reach (Stephen and Galak, 2012), and this is consistent with the fact that referral generates 13.3 times more revenue-per-visit than paid search in MFI's data.

Option 3: The company could sell its products through specialised clinical portals rather than continuing to drive traffic to the MFI website. This option takes the referral finding to its conclusion, and it could have the greatest potential impact of the three options taken into consideration. However, its feasibility is low in the near term, and it involves structural rather than operational risks because it would lose the direct relationship with the customer and the personalisation and reordering functionality that constitutes MFI's stated value proposition. It is probably not the best option for now, but it can be flagged as a natural strategic question if Option 2's pilots exceed expectations.

6. Recommended Solution

MFI should adopt Option 2 because it proposes to invert the channel allocation toward referral partnerships, email and retention, and to cut the media budget from ₹200,000 to approximately ₹58,000 per month, which is the level the gross margin can sustain. The priority customers of the company are the doctor-owners of polyclinics and independent practices, aged 35 to 54, who work in the eight cities that already generate the large majority of MFI's revenue: New Delhi, Bengaluru, Mumbai, Hyderabad, Chennai, Pune, Kolkata, and Ahmedabad. Thus, this recommendation suggests that the company abandons its idea of targeting small towns because data gathered across three years show that it did not work since New Delhi converted at 0.89%, while smaller towns such as Jodhpur, Amritsar and Varanasi recorded 0 transactions across the entire period. The company should also prioritise returning visitors as a high-value segment because they currently receive no attention from the business (Venkatesan and Kumar, 2004).

MFI should emphasise activities such as paid placement and affiliate partnerships with the five named clinical trade sites (Libai, Biyalogorsky and Gerstner, 2003), and build a first-party email programme based on existing customers and website data, rather than purchased lists (Zhang, Kumar and Cosguner, 2017). This is because email is the channel that shows the strongest engagement on the website, with 8.70 pages per session, 340 seconds average session duration and 1.14% conversion rate on almost no reach, making it the cheapest source of incremental revenue currently available. The company also needs to continue to invest in reorder campaigns to target returning buyers and the production of organic traffic and content.

MFI should also entirely stop campaigns on Google Display and Instagram, reduce prospecting for new customers on Facebook by focusing only on retargeting, restrict paid search to high-

intent product and category terms that indicate a high level of interest and stop buying third-party email lists (Blake, Nosko and Tadelis, 2015). Moreover, MFI needs to renegotiate its arrangement with the agency from a fixed retainer to a structure linked to performance, because at the affordable budget level a ₹100,000 monthly retainer would cost nearly twice the media it manages. The company should repoint the two employees at the call centre from telemarketing, which produced no long-term contracts in three years, to account management of existing buyers, reallocating an already-funded resource that costs nothing to the business.

Even if firms tend to over-invest in retaining unprofitable customers (Reinartz and Kumar, 2002), this recommendation is mainly based on retention not because it is a core value of the company but because returning visitors convert 7.94 times better than new visitors in MFI's data. Option 2 is also the only one that simultaneously addresses both the channel mix and the absolute level of expenditure, and it is reversible because individual projects can be scaled up or dropped on a quarterly basis as data are gathered, restoring the feedback loop that MFI has never had. For these reasons, this option outperforms the other two because Option 1 does not change the underlying arithmetic, and Option 3 cannot be executed within MFI's remaining financial resources.

7. Implementation Plan

The recommended solution will be implemented into three phases across six months (see Appendix B for the full implementation timeline), and it will follow a sequencing logic starting with the adjustment of the tracking process, because any subsequent reallocation decisions in Phases 2 and 3 depend on MFI's ability to measure their effects (Chaffey and Ellis-Chadwick, 2022).

Phase 1, months 0 to 1, focuses on stopping every activity that is a loss of money and restoring the measurement instruments that MFI needs before any reallocation can be trusted. Thus, Google Display and Instagram are terminated immediately, paid search is narrowed to high-intent terms, and tracking is repaired through tagging of every product page, constant enforcement of UTM conventions, correction of the duplicated region configuration, and linking of revenue tracking to every category domain. Reporting is reorganised into a single overview, and renegotiations of the contract with the agency begin. This phase uses technical hours already included in the existing consultancy contract and the company supervision in order to free up approximately ₹140,000 per month from the budget starting from the first month.

Phase 2, months 1 to 3, reallocates the budget that has been freed up. MFI contacts the five designated partner sites with proposals for paid placement and affiliate partnerships with the aim of securing at least three agreements. The company creates a first-party mailing list from existing customers and website data, launches reorder campaigns for specific product categories, redirects the call centre towards account management, and transforms the current "Order again" function from a passive element on the website into an active, targeted

campaign. The only new resource required is a part-time partnership manager because the existing call centre staff are simply reassigned, not replaced.

Phase 3, months 3 to 6, focuses on consolidating the initial results by creating content hubs focused on the categories with the best conversion rates, it will introduce a monthly review to reallocate the budget between channels based on actual performance, and will require a quarterly zero-based reorganisation in which each expenditure item has to be justified, creating a reallocation cycle that will produce more benefits than a single corrective adjustment (Fischer et al., 2011). Partnerships will be extended to the categories validated by the projects in Phase 2. This phase requires only a couple of hours per month of the founder's time and a dedicated analyst.

8. KPI and Measurement Framework

Performance will be measured through a four-tier framework, which runs from outcome metrics, through channel and leading indicators, to data quality, matching each outcome measure to the factors that produce it (see Figure 4; Kaplan and Norton, 1996). Tier 4 exists because it is what makes Tiers 1 to 3 reliable, and it directly addresses the monitoring issues; without it, the other levels risk repeating the MFI's original measurement error.

In the analysis, out of eighteen indicators measured against target, thirteen are off target, four are not measured, and only one is on target, which is the returning-visitor conversion multiple, at 7.94, which is also the indicator to which no budget has been allocated. This performance is the strongest argument in favour of change. Moreover, the frequency constitutes the recommendation because a weekly channel review, a monthly reallocation decision with authority to shift budget between channels, and a quarterly zero-based review, in which any Tier 2 metric falling below 0.50 is proposed for reduction, show that MFI's failure was not due to lack of metrics, since the company used the full suite of Google Analytics, but to the absence of a threshold at which a metric would trigger a change in the decision-making process (Farris et al., 2010; Mintz and Currim, 2013).

KPI	How it is calculated	Current	Target	Better	Status	Review
Tier 1 - OUTCOME (monthly, founder level)						
Marketing net contribution (Rs)	Gross profit (revenue × margin) less all marketing cost, including the agency retainer	-₹ 8,680,175	₹ 0	High	OFF TARGET	Monthly
Revenue per Rs 1 of marketing spend	Total revenue ÷ total marketing investment; below 1.00 means marketing costs more than it earns	0.79	4	High	OFF TARGET	Monthly
Blended ROAS, paid channels	Paid-channel revenue ÷ paid media spend; must exceed 1 ÷ gross margin simply to break even	0.16	4	High	OFF TARGET	Monthly
CAC-to-AOV ratio	Customer acquisition cost ÷ average order value; above 1.00 means a first order never repays the cost of winning it	5.28	0.3	Low	OFF TARGET	Monthly
Media spend vs affordable budget	Committed monthly media budget ÷ monthly gross profit; above 1.00 means spending faster than the business generates	3.40	1	Low	OFF TARGET	Monthly
Tier 2 - CHANNEL (monthly, trigger allocation)						
Referral share of revenue	Referral revenue ÷ total revenue; tracks whether the partnership programme is displacing paid acquisition	27.34%	40.00%	High	OFF TARGET	Monthly
Misallocation index, paid search	Share of revenue ÷ share of media spend; below 1.00 means the channel is over-funded relative to what it returns	0.14	1	High	OFF TARGET	Monthly
Revenue per session, paid search (Rs)	Paid search revenue ÷ paid search sessions; measures the quality of bought traffic rather than its volume	₹ 12.67	₹ 50	High	OFF TARGET	Monthly
Revenue per partner per month (Rs)	Revenue attributable to each referral partner; the basis for scaling or dropping individual pilots	n/a — new programme	60000	High	Not yet tracked	Monthly
Tier 3 - LEADING INDICATORS (weekly)						
Returning-visitor share of orders	Orders from returning visitors ÷ all orders; the primary test of whether retention activity is working	73.8%	80.0%	High	OFF TARGET	Weekly
Returning conversion multiple	Returning-visitor conversion rate ÷ new-visitor conversion rate; confirms the retention opportunity persists as the base grows	7.94	5	High	On target	Weekly
Site conversion rate	Transactions ÷ sessions across all channels; the headline measure of site effectiveness	0.50%	1.00%	High	OFF TARGET	Weekly
Engaged email list size	First-party contacts who opened or clicked within 90 days; the asset all email revenue depends on	n/a — not tracked	2000	High	Not yet tracked	Weekly
Tier 4 - DATA QUALITY (monthly)						
Revenue variance between reports	Gap between channel-level and quarterly revenue ÷ channel-level revenue; measures whether reporting can be relied on at all	10.5%	2.0%	Low	OFF TARGET	Monthly
Sessions with no identified source	Sessions with no named source ÷ all sessions; untracked traffic can be neither funded nor cut	6.7%	2.0%	Low	OFF TARGET	Monthly
Revenue with no identified source	Revenue not attributable to any named source ÷ total revenue; a channel that cannot be identified cannot be funded or cut	23.6%	2.0%	Low	OFF TARGET	Monthly
Product pages with working tracking	Product pages correctly linked to revenue tracking ÷ all product pages; the case states many were never connected	n/a — not measured	1	High	Not yet tracked	Monthly
Days from month-end to reporting	Working days from month-end until the report is available; slow reporting makes timely reallocation impossible	n/a — not measured	5	Low	Not yet tracked	Monthly

Weekly channel review · Monthly reallocation decision with authority to move budget · Quarterly zero-based rebuild. Any Tier 2 metric below 0.50 is automatically tabled for reduction.

Figure 4 – KPIs and measurement framework

9. Risks, Assumptions and Limitations

It is important to underline that the 25% gross margin used in the analysis is an assumption and not a fact, but it has been used to drive the break-even analysis. In fact, a sensitivity analysis shows that the sustainable monthly media budget falls to ₹47,107 at a 20% margin and rises to ₹70,661 at 30%, with the overcommitment multiple remaining between 2.8 and 4.2 across the range. Thus, the claim that net contribution is negative and that paid channels destroy value is confirmed under any plausible margin assumption.

The recommendation implies three risks: that the advertising space available for referral and partnerships in the Indian medical media is limited, making the supply of advertising space the key constraint instead of budget, that the reduction of expenditure could accelerate the decline in revenue before the reallocation begins to have a positive effect, and that partner websites could develop competitive capabilities.

Moreover, there are several limitations in the data. For example, there is a 10.5% discrepancy in revenue figures across the reporting sheets, 6.7% of sessions have no identifiable source, 23.6% of revenue comes from no identifiable source, advertising expenditure is not reported below the channel level or consistently between sheets, the funnel columns are not strict subsets and the rows related to regions are duplicated.

These shortcomings do not undermine the recommendation, but they confirm it because a company that is unable to reconcile its revenues with a discrepancy of less than 10% cannot manage an allocation process based on data. For a company, an underlying reliable data structure is a prerequisite for valuable marketing analysis, but MFI has never had one and this is reflected in its performance (Wedel and Kannan, 2016).

10. Conclusion

In conclusion, MedfirstIndia's main problem has never been the quality of its campaign, but the absence of a process for allocating and reviewing marketing spend as data accumulated. The company decided its budget and channel split at launch, but it never revisited either across eleven consecutive quarters. In fact, according to the company's data, 92% of media expenditure returned only 13% of revenue, while referral, which is the channel with the best conversion rate (2.90%) and highest revenue per visit (₹168.50), received no budget at all. Moreover, the advertising budget was 3.40 times greater than the gross profit that funded it, and this is a gap that no reallocation could have overcome. Therefore, to solve this situation, MFI should reallocate its spend towards referral partnerships, email and customer retention, and reduce media spend to a level that its margin can actually sustain.

Appendix A – Channel Efficiency

Table 1: Channel efficiency through spend share, revenue share, conversion, AOV, CAC and ROAS.

Channel	Spend Share	Revenue Share	Conversion Rate	AOV	CAC	ROAS
Organic search	0.00%	38.58%	0.42%	₹ 4,361	-	-
Direct	0.00%	20.10%	0.58%	₹ 4,595	-	-
Referral	0.00%	27.34%	2.90%	₹ 5,811	-	-
Paid search	50.00%	7.22%	0.31%	₹ 4,082	₹ 24,000	0.17
Social	41.67%	5.92%	0.22%	₹ 3,920	₹ 23,438	0.17
Email	8.33%	0.84%	1.14%	₹ 5,477	₹ 46,154	0.12
Total	100.00%	100.00%	0.50%	₹ 4,682	₹ 24,742	

Appendix B – Implementation Plan

Gantt chart: MFI Implementation timeline

Activity	Months 0-1		Months 1-2		Months 2-3		Months 3-4		Months 4-5		Months 5-6	
Terminate Display and Instagram												
Narrow paid search to high-intent terms												
Fix tracking												
Rebuild reporting into a single overview												
Begin agency renegotiation												
Approach 5 referral sites												
Build first-party email list												
Launch category-specific reorder campaigns												
Redirect call centre to account management												
Activate “Order again” as a prompted campaign												
Create content hubs for best-converting categories												
Monthly reallocation review (recurring)												
Quarterly zero-based budget rebuild												
Extend partnerships to validated categories												

	Stop the wasting
	Redirect
	Compound and institutionalise

Appendix C – Reconciliation of totals across dataset sheets

Table 2: Reconciliation of transactions, revenue and media spend across the dataset sheets.

Sheet	Transactions	Revenue (Rs)	Media Spend (Rs)
Channel Performance	1,811	₹ 8,479,300	₹ 7,200,000
Source Data	1,435	₹ 6,478,700	—
Quarterly Spend & Revenue	1,632	₹ 7,590,000	₹ 2,146,000
Customer Demographics	1,449	₹ 6,879,200	—
City Performance	—	₹ 6,629,973	—
Regional Analysis	1,128	₹ 5,686,600	—
Product Performance	—	₹ 3,183,211	—
E-Commerce Behaviour Funnel	191	—	—
Range across sheets	**191 – 1,811**	**3,183,211 – 8,479,300**	**2,146,000 – 7,200,000 (3.4x)**

No two sheets agree on transactions, revenue or spend. The analysis uses the Channel Performance base throughout.

Product Performance revenue in the original dataset was ₹3,180,832 because it summed rows 2-61 only, understating product revenue by ₹2,379.14. Now Product Performance revenue is ₹3,183,211 using the full product range (rows 2-62).
